

## ABSTRACT

A motor production line for producing a stator includes a press station for forming a stator core by feed therethrough of a long steel plate to punch therefrom a plurality of plates assembled into a stator core, and a stator assembling station for assembling a stator including the stator core. A stator core conveyer is arranged between the stator station and the press station to successively and directly convey the stator cores formed at the press station to the stator assembling station. Preferably, the production line further includes a rotor assembling station, and a rotor core conveyer for successively and directly conveying rotor cores formed at the press station to the rotor assembling station.
